

Protomorphogens (PMGs) are the cellular blueprints for healthy cells. That means a new healthy cell came from pre-designed instructions to perform a certain function, liver, lung, kidney, whatever, the new cell emerged from a stem cell by programmed design. That programmed design is called a protomorphogen.

PMGs are produced by the nucleus of each cell to regulate its growth and function. PMGs are nucleoproteins common to all mammals. Taking PMGs supplementally stimulates the growth of new healthy tissue as well as removing the interference to cell repair by distracting autoantibodies away from that tissue.

PMGs are vital when dealing with mutated tissue or during an autoimmune problem. Did you get that? PMGs divert your own immune system away from attacking your own tissue as is the problem with an autoimmunity.

For instance, Prostate PMG will stop an autoimmune attack against the prostate, Adrenal PMG protects the adrenals, Ovatrophin will protect the ovary, Thythropin for the thyroid, and so forth. Standard Process has over 20 PMGs for the various tissues involved.

This came from the genius of Dr. Royal Lee decades ago when the medical profession of the day, ridiculed the idea of the body attacking itself. Today, 2016, there are over 80 recognized autoimmune diseases. This is being heavily researched in universities under the name of “oral tolerization”. Apparently, as in other subjects, Dr. Lee was way ahead of his time.

However, what you want is to see the attack against your own tissue stop. Whether a mutation in the cells or an autoimmune attack, you need it to stop long enough for the tissues to heal. Essentially, a protomorphogen, a PMG, gives you the most important aspect of healing...time.
